

Quest Analytics saves time and money by automating manual data warehouse tasks.

Quest AutoTrend™ *for Fiserv Signature Data Warehouse*

Quest AutoTrend is a Microsoft Windows application built specifically to work with the Fiserv Signature/CBS data warehouse. The application automates the manual task of running daily, weekly and monthly trending scripts on a scheduled basis.

The Fiserv Signature data warehouse is an excellent tool for building reports and performing financial analysis. However, many reports use trended data. The existing data warehouse trending process requires a warehouse administrator to manually logon to the server, set the current run date, and execute a data warehouse script for each individual trend file.

The Quest AutoTrend application completely automates the process by allowing administrators to focus on analytics rather than the manual process of keeping the trending data current.

Quest AutoTrend Features:

- Quest AutoTrend is a Microsoft Windows application that runs on your existing hardware platform. It can run on any 2003 or 2008 Windows server.
- The application runs each day following the Fiserv data loading process.
- Schedules can be setup to run daily, weekly and monthly trending on any day of the month.
- System administrators receive automated email alerts each day indicating the status of the trending process.
- Automatic balancing queries compare existing tables to the trend tables to ensure trend rows were created successfully.
